

Auto Sell (Stop Loss / Profit Booking) – Simple Explanation

We are implementing **ONE simple Auto-Sell option** instead of multiple confusing settings.

User only needs to enter **one amount**.

◆ What is Auto Sell Amount?

Auto Sell Amount means:

“At what total value should my gold be sold automatically?”

System will **automatically decide** whether it is:

- **Profit booking**
- or **Loss protection**

User does **not** need to select profit or loss separately.

◆ Example 1 – Profit Booking

Purchase:

- Gold bought for **₹454**

User sets:

Auto Sell Amount = ₹460

What happens?

- As soon as gold value reaches **₹460 or above**
- System **automatically sells**
- User books **profit**

✓ No manual tracking

✓ No market watching

◆ Example 2 – Stop Loss (Loss Control)

Purchase:

- Gold bought for **₹454**

User sets:

Auto Sell Amount = ₹450

What happens?

- If gold value falls to **₹450 or below**
- System **automatically sells**
- Loss is **limited and controlled**

✓ Prevents bigger loss

✓ Peace of mind

◆ Example 3 – No Profit, No Loss (Break-Even)

Purchase:

- Gold bought for ₹454

User sets:

Auto Sell Amount = ₹454

What happens?

- When gold returns to original price
 - System sells at **no profit, no loss**
-

◆ Very Important Point (How system understands)

System compares:

What happens?

- As soon as gold value reaches **₹460 or above**
- System **automatically sells**
- User books **profit**

✓ No manual tracking

✓ No market watching

◆ Example 2 – Stop Loss (Loss Control)

Purchase:

- Gold bought for ₹454

User sets:

Auto Sell Amount = ₹450

What happens?

- If gold value falls to **₹450 or below**
- System **automatically sells**
- Loss is **limited and controlled**

✓ Prevents bigger loss

✓ Peace of mind

◆ Example 3 – No Profit, No Loss (Break-Even)

Purchase:

- Gold bought for ₹454

User sets:

Auto Sell Amount = ₹454

What happens?

- When gold returns to original price
- System sells at **no profit, no loss**

♦ Very Important Point (How system understands)

System compares:

Auto Sell Amount	Compared With
Higher than purchase value	Profit booking
Lower than purchase value	Stop loss
Same as purchase value	Break-even

What is already implemented (Current System – “Booking”)

♦ Booking (Normal Buy–Sell)

Flow:

1. User **BUY** gold/silver at current market rate
2. Amount **wallet se deduct** hota hai
3. Service fee + GST + reward deduct hota hai
4. Actual invested amount gold me convert hota hai
5. Metal user ke **Live Orders** me dikhta hai
6. User jab chahe **SELL** karta hai
7. Current rate pe profit / loss calculate hota hai
8. Final amount **wallet me credit** ho jata hai

 **Price UP → Profit**

 **Price DOWN → Loss**

♦ Example (Booking)

- Wallet recharge: ₹500
- Gold purchased: 10 gm
- Service charges ke baad **actual investment**: ₹454
- Buy gold rate: ₹15021.47/gm

Later...

- Sell gold rate: ₹15008.54/gm
- Rate thoda gira → **loss**
- Loss percent calculate hota hai

- ₹454 me se loss deduct hota hai
- Remaining amount wallet me credit hota hai

- ✓ This is **standard gold investment logic**
- ✓ This is what most users understand
- ✓ This is what I have already completed

📌 2 Live Orders & Past Orders (Already Planned)

◆ Live Orders

- Currently held metals
- Real-time profit / loss shown
- SELL button available

◆ Past Orders

- Sold metals
- Buy rate, sell rate
- Profit / loss amount & %
- History view only (no actions)

Basic (For Both Booking and Buyback)

- Customer **10 gram** ka order lagata hai
- Uske **₹500** wallet me se
 - **₹50 charges** nikal jaate hain
 - **₹450 actual trading amount** hota hai
- **1 point = ₹10** (10 gram ke liye)
- **5 point = ₹50**

👉 Ab farq sirf **market kis direction me jaati hai** usme hai

✅ Example 1 – Booking (Buy)

👉 Profit tab hota hai jab rate UP jaata hai

📌 Situation

- Current rate: **5565**
- Customer ne **Booking (Buy)** lagayi
- Quantity: **10 gram**
- Trading amount: **₹450**

● Case 1 – Market upar gaya (Profit)

- Rate: **5565 → 5570**
- Difference: **5 points**
- Profit: **₹50**

👉 Customer ne order close kiya

👉 Wallet calculation:

₹450 (trading amount)

+ ₹50 (profit)

= ₹500 wallet me add

✓ Customer ko **profit hua**

● Case 2 – Market neeche gaya (Loss)

- Rate: **5565 → 5560**
- Difference: **5 points**
- Loss: **₹50**

👉 Customer ne order close kiya

👉 Wallet calculation:

₹450 (trading amount)

- ₹50 (loss)

= ₹400 wallet me add

✗ Customer ko **loss hua**

🔑 Booking ka rule (simple line)

Booking (Buy) me market UP jaaye to profit, DOWN jaaye to loss

🔄 Example 2 – Buyback (Sell)

👉 *Profit tab hota hai jab rate DOWN jaata hai*

📌 Situation

- Current rate: **5565**
 - Customer ne **Buyback (Sell)** lagayi
 - Quantity: **10 gram**
 - Trading amount: **₹450**
-

● Case 1 – Market neeche gaya (Profit)

- Rate: 5565 → 5560
- Difference: 5 points
- Profit: ₹50

👉 Customer ne order close kiya

👉 Wallet calculation:

₹450 (trading amount)

+ ₹50 (profit)

= ₹500 wallet me add

✓ Customer ko **profit hua**

● Case 2 – Market upar gaya (Loss)

- Rate: 5565 → 5570
- Difference: 5 points
- Loss: ₹50

👉 Customer ne order close kiya

👉 Wallet calculation:

₹450 (trading amount)

- ₹50 (loss)

= ₹400 wallet me add

✗ Customer ko **loss hua**

🔑 Buyback ka rule (simple line)

Buyback (Sell) me market DOWN jaaye to profit, UP jaaye to loss

🧠 One-line difference (client-friendly)

Booking = market badhne par profit

Buyback = market girne par profit
